the book is composed of two parts the first part introduces the concepts of the design of digital systems using contemporary field programmable gate arrays fpgas various design techniques are discussed and illustrated by examples the operation and effectiveness of these techniques is demonstrated through experiments that use relatively cheap prototyping boards that are widely available the

book begins with easily understandable introductory sections continues with commonly used digital circuits and then gradually extends to more advanced topics the advanced topics include novel techniques where parallelism is applied extensively these techniques involve not only core reconfigurable logical elements but also use embedded blocks such as memories and digital signal processing slices and interactions with general purpose and application specific computing systems fully synthesizable specifications are provided in a hardware description language vhdl and are ready to be tested and incorporated in engineering designs a number of practical applications are discussed from areas such as data processing and vector based computations e g hamming weight counters comparators the second part of the book covers the more theoretical aspects of finite state machine synthesis with the main objective of reducing basic fpga resources minimizing delays and achieving greater optimization of circuits and systems

africa which was not long ago discarded as a hopeless and irrelevant region has become a new frontier for global trade investment and the conduct of international relations this book surveys the socio economic intellectual and security related dimensions of african regionalisms since the turn of the 20th century it argues that the continent deserves to be considered as a crucible for conceptualizing and contextualizing the ongoing influence of colonial policies the emergence of specific integration and security cultures the spread of cross border regionalisation processes at the expense of region building the interplay between territory space and trans state networks and the intrinsic ambivalence of global frontier narratives this is emphasized through the identification of distinctive threads of regionalism which by focusing on genealogies trajectories and ideals transcend the binary divide between old and new regionalisms in doing so the book opens new perspectives not only on africa in international relations but also africa s own international relations this text will be of key interest to students and scholars of african politics african history regionalism comparative regionalism and more broadly to international political economy international relations and global and regional governance

a key concern of researchers involved in the creation and sharing of language resources is to attain maximum usability reliability and longevity of these resources for present and future researchers in the language sciences the view developed in this volume is that spoken corpora construction and sharing are major research endeavours that should also be laid open to academic debate in a manner that is more visible than is currently the case in corpus linguistics the present volume brings together multiple research perspectives to bear on the question of what constitutes best practices for the construction of spoken corpora the book brings into closer contact scholars whose specializations have often remained in relatively different streams of scientific investigation that is scholars whose work falls primarily in conversation analysis pragmatics and discourse analysis but who are involved in spoken corpus compilation on the one hand and scholars who also specialize in linguistics but who have been intensively involved in developing various infrastructures for spoken corpora on the other hand this combination of scholars brings into better relief the concerns of data providers data curators and

data users in linguistic research this book is thus unique in that it highlights best practices from both the perspective of assembling annotating and linguistic analysis of spoken corpora as well as from the perspective of processing archiving and disseminating spoken language in doing so the contributions emphasise not only the considerable promise that the rapid technological changes that society continues to experience in this area offer but also possible dangers for the unwary

provides a global view of the recent advances in the biological sciences and the adaption of the pathogen to the host plants revealed using ngs molecular omic s is now a major driving force to learn the adaption genetics and a great challenge to the scientific community which can be resolved through the application of the ngs technologies the availability of complete genome sequences the respective model species for dicot and monocot plant groups presents a global opportunity to delineate the identification function and the expression of the genes to develop new tools for the identification of the new genes and pathway identification genome wide research tools resources and approaches such as data mining for structural similarities gene expression profiling at the dna and rna level with rapid increase in available genome sequencing efforts expressed sequence tags ests rna seq gene expression profiling induced deletion mutants and insertional mutants and gene expression knock down gene silencing studies with rnai and micrornas have become integral parts of plant molecular omic s molecular diversity and mutational approaches present the first line of approach to unravel the genetic and molecular basis for several traits qtl related to disease resistance which includes host approaches to combat the pathogens and to understand the adaptation of the pathogen to the plant host using ngs technologies understanding of adaptation genetics towards stress tolerance has been correlated to the epigenetics naturally occurring allelic variations genome shuffling and variations induced by

chemical or radiation mutagenesis are also being used in functional genomics to elucidate the pathway for the pathogen and stress tolerance and is widely illustrated in demonstrating the identification of the genes responsible for tolerance in plants bacterial and fungal species

this second edition explores some of the latest techniques used to provide forecasts for a wide range of water related applications in areas such as floods droughts water resources and environmental impacts the practical uses can range from decisions on whether to issue a flood warning through to providing longer term advice such as on when to plant and harvest crops or how to operate reservoirs for water supply and hydropower schemes it provides an introduction to the topic for practitioners and researchers and useful background for courses in areas such as civil engineering water resources meteorology and hydrology as in the first edition the first section considers topics such as monitoring and forecasting techniques demand forecasting and how forecasts are interpreted when issuing warnings or advice separate chapters are now included for meteorological and catchment monitoring techniques allowing a more in depth discussion of topics such as weather radar and water quality observations the chapters on meteorological and hydrological forecasting now include a greater emphasis on rainfall forecasting and ensemble and probabilistic techniques regarding the interpretation of forecasts an updated chapter discusses topics such as approaches to issuing warnings and the use of decision support systems and risk based techniques given the rapid pace of development in flash flood fore casting techniques flash floods and slower responding riverine floods are now considered in separate chapters this includes more detail on forecasting floods in large river basins and on methods for providing early warnings of debris flows surface water flooding and ice jam and dam break floods later chapters now include more information on developing areas such as environmental modelling and seasonal flow forecasting as before examples of operational systems are provided throughout and the extensive sets of references which were a feature of the first edition have been revised and updated key themes floods droughts meteorological observations catchment monitoring meteorological forecasts hydrological forecasts demand forecasts reservoirs water resources water quality decision support data assimilation probabilistic forecasts kevin sene is a civil engineer and researcher with wide experience in flood risk management water resources and hydrometeorology he has previously published books on flood warning forecasting and emergency response and flash floods springer 2008 2013

we live in a time when public discourse is more skewed than ever by the propaganda that big money can buy with trust in the leadership of elected officials at an all time low the news has degenerated into sensationalist sound bites and the idea of debate has become a polarized shouting match that precludes any meaningful discussion it s also a time of anxiety as we re faced with economic and ecological crises on a global scale with stakes that seem higher than ever before in times like these it s essential that we be able to think and communicate clearly in this lively primer on critical thinking robert jensen attacks the problems head on and delivers an accessible and engaging book that explains how we can work collectively to enrich our intellectual lives drawing on more than two decades of classroom experience and community organizing jensen shares strategies on how to challenge conventional wisdom in order to courageously confront the crises of our times and offers a framework for channeling our fears and frustrations into productive analysis that can inform constructive action jensen connects abstract ideas with the everyday political and spiritual struggles of ordinary people free of either academic or political jargon this book is for anyone struggling to understand our world and contribute to making it a better place robert jensen is a professor in the school of journalism at the university of texas at austin and a founding board member of the third coast activist resource center at the moment what passes for political debate is the bickering of two vociferous and wrong headed parties robert jensen reacquaints us with the political and social skills we ll need if we re to reclaim politics for the 21st century this is a brave book one that packs more wisdom in its few pages than a shelf s worth of political theory because it s also a book about political practice jensen patiently honestly and rigorously exemplifies the highest virtues of a public intellectual raj patel author of stuffed and starved markets power and the hidden battle for the world s food system the first date or dinner party taboo is famous no religion no politics debating discussion engagement with ideas that matter these are all supposed to be left to professionals specialists who talk to each other in mutually incomprehensible ways meanwhile decades of advertising sound bites pr filtered information and internet trolling have numbed us even more but we don t have to live this way we could immediately start living in a better world one in which every conversation was an opportunity to learn more about ourselves others and the precious little world we all have to try to live on together to do that though we would have to re learn how to think and talk how to agree and disagree robert jensen s arguing for

the oxford handbook of computational economics and finance provides a survey of both the foundations of and recent advances in the frontiers of analysis and action it is both historically and interdisciplinarily rich and also tightly connected to the rise of digital society it begins with the conventional view of computational economics including recent algorithmic development in computing rational expectations volatility and general equilibrium it then moves from traditional computing in economics and finance to recent developments in natural computing including applications of nature inspired intelligence genetic programming swarm intelligence and fuzzy logic also examined are recent developments of network and agent based computing in economics how these approaches are applied is examined in chapters on such subjects as trading robots and automated markets the last part deals with the epistemology of simulation in its trinity form with the integration of simulation computation and dynamics distinctive is the focus on natural computationalism and the examination of the implications of intelligent machines for the future of computational economics and finance not merely individual robots but whole integrated systems are extending their immigration to the world of homo sapiens or symbiogenesis
